Terrapins, members of the tortoise order, are similar in appearance to many of the most common types of turtles. Best known of the North Carolina terrapins are the <u>diamondbacks</u> [3] (*Malaclemys terrapin*), which breed in marshy areas near the seacoast and were once a minor, though lucrative, part of the state's commercial fishing industry. <u>Diamondback terrapin soup</u> [4], made with sherry and a thick cream sauce, was considered a delicacy in northern cities before the <u>Civil</u> War [5].

[2]

The first recorded commercial terrapin catch in North Carolina occurred in February 1849, when the keeper of the Bodie Island lighthouse [6], using a specially designed dredge, caught 2,150 diamondbacks that he sold in Norfolk, Va., for \$400. By 1880 the total marketed yield in the state was 123,000 pounds, but thereafter the terrapin fishery declined, with only occasional catches reported after World War II [7].

By the early 2000s, diamondbacks were threatened sufficiently by net fishermen and coastal development to be categorized as a "species of special concern." At the same time, the unique coloring and design on their shells has resulted in their being sought mainly by herpetologists and hobbyists.
