<sup>[10]</sup>

Climate and Weather in North Carolina are as varied as that of any state, with four distinct seasons and a wide variety of conditions and storms, from paralyzing snowstorms in winter to major hurricanes in late summer and fall. Because the state's geography ranges from Atlantic [coastline](#) <sup>[11]</sup> in the east to western [mountains](#) <sup>[12]</sup> reaching several thousand feet in height, temperature extremes in North Carolina vary greatly from place to place and from season to season. The overall climate is relatively warm; even in the mountains, North Carolina's coldest region, the average temperature in January remains above freezing. The state's record low is -25°, recorded at [Grandfather Mountain](#) <sup>[13]</sup> in [Avery County](#) <sup>[14]</sup> on 30 Jan. 1966. North Carolina's highest recorded temperature, 110°, occurred at [Fayetteville](#) <sup>[15]</sup> on 22 Aug. 1983. The frost-free season in the state ranges from an average of 170 days in the west to 280 days in the east.
